Take-aways

- Motorcycle Crash Causation Study (MCCS) in the U.S.
- Tight matched case-control study design.
- Effects of different "policy-sensitive" factors on risk of MC injury crash propensity.
- Rigorous heterogeneity-based case-control analysis framework is presented.
- Effects of key variables on injury crash propensity:
 - Lack of motorcycle rider conspicuity dark (red) color upper clothing (↑)
 - Motorcycle-oriented lower clothing (↓)
 - Formal training in recent years (↓)
 - Riders with less sleep prior to crash/interview (↑)
 - **■** Least intrusive US-DOT compliant partial helmets (↓)
- Observed & unobserved heterogeneity in effects of speed as a function of alcohol/multiple drug involvement.
- Future: Need to quantify the number of lives that can be saved or injuries prevented with "high-priority" interventions.

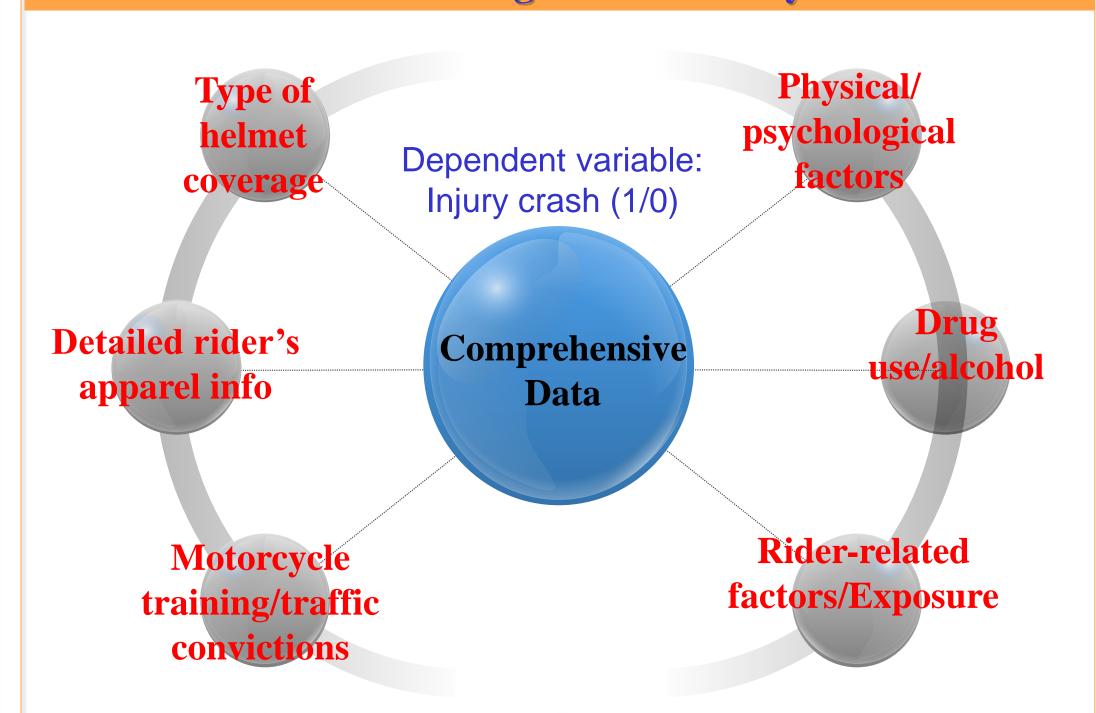

Conceptual Framework

Research Question

- How different "policy-sensitive" factors relate to the risk of motorcycle injury crashes?
- Data: Orange County, California.
- 351 cases (riders involved in injury crashes)
- Similarly-at-risk 702 matched controls (riders not involved in injury crashes)
- Cases matched with controls by *time of day, day of week, road type, urban/rural, location, & travel direction.*

Data Linkage and Assembly

Methodological Framework

Proposed Approach:

- Random parameters logit models.
- Random parameters logit with *heterogeneity-in-means*.
- Models operating at individual observation & matched-triplet levels.
 Motivation:

Captures between-observation or between-triplet unobserved & observed heterogeneity.

More accurate estimates/deeper insights.

Model Selection

| Goodness of Fit Measures | Models for | | observatior plet structur | Models for matched-triplets (accounting for matched-triplet structure) | | | |
|-----------------------------|------------|-----------|---------------------------|--|-----------|------------|-------------|
| | Model 1* | Model 2** | Model 3*** | Model 4**** | Model 5** | Model 6*** | Model 7**** |
| N (obs.) | 1053 | 1053 | 1053 | 1053 | 1053 | 1053 | 1053 |
| # of triplets | | | | | 351 | 351 | 351 |
| Degrees of Freedom | 24 | 31 | 32 | 39 | 31 | 32 | 40 |
| Log-likelihood with | | | | | | | |
| constant only, Lo | -670.24 | -670.24 | -670.24 | -670.24 | -670.24 | -670.24 | -670.24 |
| Log-likelihood at | | | | | | | |
| convergence, Lc | -305.7 | -288.623 | -288.74 | -277.6 | -293.68 | -294.11 | -291.4 |
| Chi-square statistic | | | | | | | |
| [2(Lc - Lo)] | 729.08 | 763.234 | 763 | 785.28 | 753.12 | 752.26 | 757.68 |
| AIC | 659.4 | 639.2 | 641.5 | 633.2 | 649.4 | 652.2 | 662.8 |

Model 4 highlighted in bold is the best-fit model

Notes:

- * Fixed parameter model
- ** Random parameters model
- *** Random intercept and random parameters model
- **** Random parameters/random intercepts with heterogeneity-in-means

ROAD SAFETY

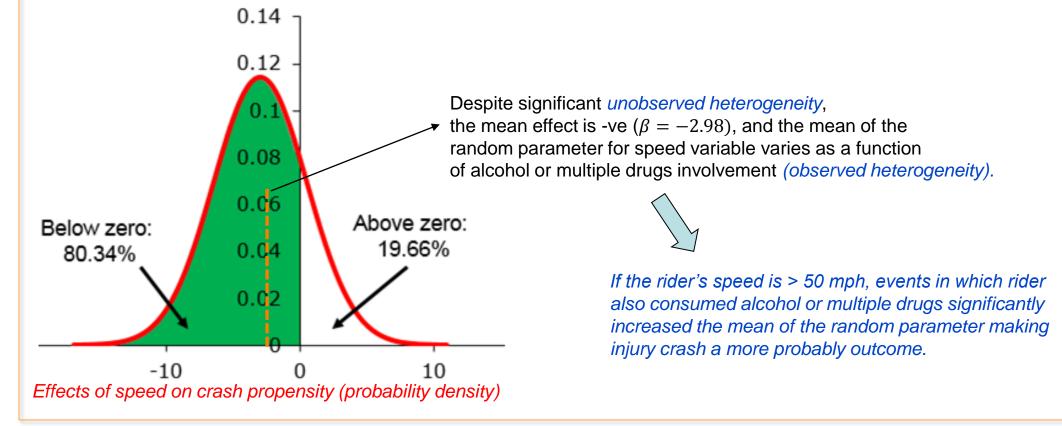

Selected Results (Relative Risk Estimates)
